

Geographic Information Systems
Week-11: Assignment-11

- 1 The shape of a cell of a DEM can only be:
(a) Rectangular
(b) Circular
(c) Square
(d) Triangle
- 2 Overall shape of a DEM can only be:
(a) Rectangular and square
(b) Circular and triangular
(c) Square and circular
(d) Triangle and rectangular
- 3 An 8-bits DEM can have total number of positive integer cell values:
(a) 64
(b) 128
(c) 256
(d) 65536
- 4 A DEM that shows finer details is said to be of:
(a) High resolution
(b) Coarser resolution
(c) Moderate resolution
(d) Poor resolution
- 5 Which of the following is NOT a raster data structure?
(a) Spaghetti
(b) Run-length encoding
(c) Quadtree
(d) Block encoding
- 6 Which of the following is advantage of DEMs over TINs?
(a) DEMs do not require interpolation of point heights
(b) DEMs do not require resampling if irregularly spaced input data is used
(c) DEMs efficiently store data over varied terrain
(d) DEMs use a simple data model
- 7 The accuracy of a DEM created from DGNSS data will be low:
(a) True
(b) False
- 8 A 'surface significant' point in a TIN model is one which can be closely interpolated from its neighbours.
(a) True
(b) False
- 9 Spatial resolution of a DEM is?
(a) Can be improved later

- (b) Vary with time
- (c) Fixed once the DEM is created**
- (d) None of the above

10 DSM is a surface which can be used to represent:

- (a) Groundwater levels
- (b) Chemical qualities of soils
- (c) Chemical qualities of water
- (d) All of the above**

----- END -----
