

Geographic Information Systems

Week-4: Assignment-4

- 1 Basic GIS functions are:
 - (a) Area and distance measurement
 - (b) Buffer generation
 - (c) Reclassification
 - (d) All of the above**
- 2 Basic spatial analysis involves:
 - (a) Attribute query
 - (b) Spatial query
 - (c) Both attribute and spatial queries**
 - (d) Auto query
- 3 What is a model?
 - (a) A model is a suite of computer programs.
 - (b) A model is a set of instructions to a GIS.
 - (c) A model is a method for storing spatial data.
 - (d) A model is a simplification of reality.**
- 4 “Points close together in space are more likely to have similar values than points farther apart” is known as?
 - (a) Tottenham Law of Geography
 - (b) Totler's Law of Geography
 - (c) Tobler's Law of Geography**
 - (d) Tobin Law of Geography
- 5 Which of the following spatial interpolation techniques is an example of a local, exact, abrupt and deterministic interpolator?
 - (a) TIN
 - (b) Spline
 - (c) Thiessen polygons**
 - (d) Spatial moving average
- 6 Spatial interpolation is the procedure of estimating the value of properties at:
 - (a) Observational location
 - (b) Un-sample sites**
 - (c) Sample sites
 - (d) None of the above
- 7 Preprocessing in GIS involves the following:
 - (a) Format conversion
 - (b) Generalization
 - (c) Merging
 - (d) All of the above**
- 8 The following are also part of processing:
 - (a) Georeferencing
 - (b) Interpolation
 - (c) Image interpretation
 - (d) None of the above**

- 9 One type of image fusion / merging technique is based on:
- (a) **Colour transformations**
 - (b) Image transformations
 - (c) Geographic transformations
 - (d) Geometric transformations
- 10 Reclassification involves the selection and presentation of a selected layer of data based on the classes or values of a specific:
- (a) **Attribute**
 - (b) Object
 - (c) Pixel
 - (d) Cell

----- END -----
