

Geographic Information Systems

Week-6: Assignment-6

- 1 How many kinds of network elements are currently known in GIS?
 - (a) 1
 - (b) 2
 - (c) 3**
 - (d) 4
- 2connect edges and facilitate navigation from one edge to another:
 - (a) Edges
 - (b) Junctions**
 - (c) Turns
 - (d) None of the above
- 3 The movement of people, transportation and distribution of services and allocation delivery of resources occurs through a:
 - (a) Geographic system
 - (b) Geometric system
 - (c) Geodesic system
 - (d) Network system**
- 4 The determination of the shortest path between connected points or nodes within the network based on attribute values is often referred to as:
 - (a) Route optimization**
 - (b) Relational optimization
 - (c) Conditional optimization
 - (d) Conceptual optimization
- 5 In which analysis four components (a set of resources, location of resources, a destination and a set of constraints) are usually considered:
 - (a) Buffer analysis
 - (b) Geometric analysis
 - (c) Geodesic analysis
 - (d) Network analysis**
- 6 The process of organizing data into group / categories according to shared qualities or characteristics is called as:
 - (a) Modification
 - (b) Classification**
 - (c) Ossification
 - (d) Ramification
- 7 For attribute categorization, how many types are commonly used in GIS:
 - (a) 3
 - (b) 4
 - (c) 5
 - (d) 6**
- 8 The method in which each class contains the same number of features is known as:

- (a) Natural Breaks (Jenks)
 - (b) Quantile**
 - (c) Equal Area
 - (d) Standard Deviations
- 9 The method in which the mean value is found and then class breaks above and below the mean at intervals of either $1/4$, $1/2$, or 1 standard deviations are placed until all the data values are contained within the classes is:
- (a) Quantile
 - (b) Equal Area
 - (c) Standard Deviations**
 - (d) Geometrical interval
- 10 Data anomalies includes:
- (a) Modification
 - (b) Insertion
 - (c) Deletion
 - (d) All of the above**

----- END -----
